

## Student Well-being App – A Survey creation and delivery system for monitoring student well-being

Andrew Lyden

BSc in Computer Science, hy022155@rdg.ac.uk

### ABSTRACT

Student well-being is an extremely important topic in the current education climate, where high stress levels can have a large impact on overall performance, motivation, and health. It is important for infrastructure to be developed to help gather information relating to student well-being. This paper outlines the design and implementation of a novel survey creation and delivery system, which consists of a web interface for designing custom surveys and an android application for the delivery to the student. A normalised relational database management system has been designed and incorporated for storing the collected data, ready for further analysis.
