ABSTRACT

There are a number of book exchanging services allowing customers to buy and sell their unwanted books to each other. However, the buying and selling price is not normally set by the customer. An internet service allowing students to exchange their books amongst each other on campus eliminates delivery costs and allows students to set their own prices. The website must be designed to; navigate easily, search the database quickly and provides a service which eliminates the common problems with commercial e-commerce services. The Universe Marketplace is live and a survey with 339 responses indicates that the service meets the design requirements.
