E-Learning on Android
Grant Benbow
BSc Computer Science

ABSTRACT
E-Learning is an important tool in the education of primary and secondary students and is becoming more and more popular within the educational system. Unfortunately the majority of software is either unfeasible or unsuitable for generic use within the classroom. Creating an interactive system on a popular platform is obviously a step towards the right direction for the education system. Android is such a system that could help further E-Learning systems, combined with good educational content and interactive skill based learning it can provide a powerful yet elegant solution to creating good educational software. With the support of the educational community there is little limit on the educational benefits of such a mobile E-Learning system.
