Cognitive Therapy for Social Anxiety Disorders in Adults and Adolescents

Introduction:
A Social Anxiety Disorder is common and remarkably persistent in the absence of treatment. It typically starts in childhood or adolescence and frequently leads to occupational and education underachievement. Interpersonal relationships are impaired. Dissatisfaction with the way that life is progressing often triggers depressive episodes and there is a heightened risk of alcohol and drug abuse.

Content:
The workshop provides a comprehensive and practical guide to cognitive therapy for social anxiety disorder, with both adults and adolescents. It starts with an overview of the cognitive model, focussing on its treatment implications. Each of the steps in treatment is then described and illustrated with case material and videos of treatment sessions. The key procedures include: deriving with patients an individualized cognitive model; demonstrating the adverse effects of self-focussed attention and safety behaviours through experiential exercises; video feedback and other procedures to correct excessively negative self-imagery; training in externally focussed, non-evaluation attention; behavioural experiments to test negative beliefs; and ways of dealing with socially relevant traumatic memories (discrimination training & memory re-scripting). Guidance on the use of the most appropriate measures for identifying therapy targets and monitoring progress is also provided.

Learning objectives:
By the end of the workshop, participants should be able to:

- Identify the key psychological processes in maintaining social anxiety disorder
- Develop an individual version of the cognitive model with their clients and
- Be able to identify appropriate therapeutic strategies and be familiar with how to apply them
Training modalities

Case illustrations, video demonstrations and role-plays between participants.

About the presenter:
David M Clark holds the Chair of Experimental Psychology at University of Oxford and is the National Clinical and Informatics Advisor for the IAPT programme. He is well known for his research on the understanding and treatment of anxiety disorders. With colleagues, he has developed new and highly effective forms of cognitive therapies for panic disorder, post-traumatic stress disorder, and social anxiety disorder. In all three instances, the treatments are recommended as first choice interventions in the relevant NICE Clinical Guidelines. Recognition of his work includes major awards from British Psychological Society, Canadian Psychological Association, American Psychological Association, Association for Psychological Science, BABCP, ABCT on the Swedish and Dutch CBT Associations. He was awarded a CBE for services to mental health.

Cost of 1-day workshop:
£130 including lunch

All workshops, unless otherwise indicated are intended for a cross/mixed ability audience, and are held local to Reading
