Summary: The building services sector holds a key role within the sustainable development agenda which covers economic, social, environmental and cultural values. Understanding the building services sector position within the wider building industry is essential in restructuring itself to take on this role. The planning that goes into a building; the methods of construction and installation used to make those plans a reality; all determine the quality of both the building and the indoor environment. The choice of technology for the completion of the project involves a whole range of stakeholders and practitioners in achieving the design. This paper sets out the conceptual framework into the research for the development of these practitioners as the basis for achieving sustainable environmental services.
